

- Applied design sprints to inform our process. I was able to effectively apply the design sprints process to identify the problem, ideate on the solution, prototype and implement the final product.
- Executed end to end. The fact that the engineers were able to code the final designs in such a short period of time demonstrated our ability to execute and ship features as a team.
- Placed 2nd in the Hackathon. It's worth noting that the best designs are not a result of the designer on the team. Each person from design and engineering was able to contribute to the solution which resulted in a very collaborative and impressive result.
